A7: Predicting Diabetes using decision tree

Aim: Develop a python program to predict diabetics using Decision Tree Model. Visualize the features from the dataset and interpret the results obtained by the model using Matplotlib library.

The Diabetes prediction dataset is a collection of medical and demographic data from patients, along with their diabetes status (positive or negative). The data includes features such as age, gender, body mass index (BMI), hypertension, heart disease, smoking history, HbA1c level, and blood glucose level. This dataset can be used to build machine learning models to predict diabetesin patients based on their medical history and demographic information. This can be useful for healthcare professionals in identifying patients who may be at risk of developing diabetes and in developing personalized treatment plans. Additionally, the dataset can be used by researchers to explore the relationships between various medical and demographic factors and the likelihood of developing diabetes.

```python
[1]: import pandas as pd
import numpy as np
import seaborn as sns
from scipy.stats import zscore
import matplotlib.pyplot as plt
from sklearn import tree
from sklearn.preprocessing import MinMaxScaler
from sklearn.metrics import classification_report, roc_auc_score,␣
 ↪confusion_matrix, ConfusionMatrixDisplay, RocCurveDisplay, roc_auc_score
from sklearn.model_selection import train_test_split
from sklearn.neighbors import KNeighborsClassifier
from sklearn.naive_bayes import MultinomialNB
from sklearn.tree import DecisionTreeClassifier
from sklearn import preprocessing
from sklearn.decomposition import PCA
```

```
import scipy.stats
from sklearn.metrics import PrecisionRecallDisplay
from sklearn.metrics import confusion_matrix, ConfusionMatrixDisplay
from sklearn.neighbors import KNeighborsClassifier

pd.set_option("display.float_format", lambda x: "%.2f" % x)
%matplotlib inline
```

C:\Users\Nithi\AppData\Local\Temp\ipykernel_13632\1512000984.py:1: DeprecationWarning: Pyarrow will become a required dependency of pandas in the next major release of pandas (pandas 3.0),
(to allow more performant data types, such as the Arrow string type, and better interoperability with other libraries)
but was not found to be installed on your system.If this would cause problems for you,

    import pandas as pd

3   Loading dataset

[2]:
```
data = pd.read_csv("C:/Users/ashwi/Downloads/ML Lab/A7/
    ↳diabetes_prediction_dataset.csv")
```

[3]:
```
data.head()
```

[3]:
```
   gender   age  hypertension heart_disease  smoking_history bmi \
   Female 80.00             0             1             never 25.19
1  Female 54.00             0             0           No Info 27.32
2    Male 28.00             0             0             never 27.32
3  Female 36.00             0             0           current 23.45

7 Train the model

[23]:
```
pca = PCA(random_state=42)
pca.fit(X_train)
```

[23]: PCA(random_state=42)

[24]:
```
# Calculate the cumulative explained variance ratio
cumulative_variance = pca.explained_variance_ratio_.cumsum()

# Find the number of components needed for 90% variance
n_components_90 = (cumulative_variance <= 0.90).sum()

print("Number of components to explain 90% variance:", n_components_90)
```

[25]:
```
pca = PCA(n_components=5, random_state=42)
pca.fit(X_train)
```

```python
X_train_PCA = pd.DataFrame(pca.transform(X_train))
X_test_PCA = pd.DataFrame(pca.transform(X_test))
```

[26]:
```python
X_train_PCA.columns = [str(column_name) for column_name in X_train_PCA.columns]
X_test_PCA.columns = [str(column_name) for column_name in X_test_PCA.columns]
```

[27]:
```python
X_train_PCA.head()
```

8   Test the model

[28]:
```python
model = tree.DecisionTreeClassifier()
```

[29]:
```python
model.fit(X_train_PCA, y_train)
```

[29]: DecisionTreeClassifier()

[30]:
```python
fig = plt.figure(figsize=(20,15))
tree.plot_tree(model);
```
```
feature_importances = pd.Series(model.feature_importances_, model.
  ↪feature_names_in_).sort_values()
feature_importances.plot.barh();
plt.title("Decision Tree Feature Importance");
```

Decision Tree Feature Importance
[32]:
```
y_pred_test = model.predict(X_test_PCA)
y_pred_train= model.predict(X_train_PCA)
```

9   Measure the performance of the trained model

[33]:
```
train_decision_tree_report = classification_report(y_train, y_pred_train)
print(train_decision_tree_report)
```

	precision	recall	f1-score	support
0	1.00	1.00	1.00	64047
1	1.00	0.99	1.00	5953
accuracy			1.00	70000
macro avg	1.00	1.00	1.00	70000
weighted avg	1.00	1.00	1.00	70000

[34]:
```
test_decision_tree_report = classification_report(y_test, y_pred_test)
print(test_decision_tree_report)
```

	precision	recall	f1-score	support
0	0.96	0.97	0.97	27453
1	0.62	0.62	0.62	2547
accuracy			0.94	30000
macro avg	0.79	0.79	0.79	30000
weighted avg	0.94	0.94	0.94	30000

10 Represent the results using graphs

[35]:
```python
RocCurveDisplay.from_estimator(model, X_test_PCA, y_test)
plt.show()
```

[36]:
```python
from sklearn.tree import DecisionTreeClassifier
from sklearn.metrics import accuracy_score
from sklearn.decomposition import PCA
from sklearn.model_selection import train_test_split
import numpy as np
```

```python
X_train, X_test, y_train, y_test = train_test_split(X_train_PCA, y_train,
    ↪test_size=0.2, random_state=42)

dt_entropy = DecisionTreeClassifier(criterion="entropy", random_state=42)
dt_entropy.fit(X_train, y_train)

y_pred_entropy = dt_entropy.predict(X_test)

accuracy_entropy = accuracy_score(y_test, y_pred_entropy)
print("Accuracy using Entropy impurity measure with PCA:", accuracy_entropy)

dt_gini = DecisionTreeClassifier(criterion="gini", random_state=42)
dt_gini.fit(X_train, y_train)

y_pred_gini = dt_gini.predict(X_test)

accuracy_gini = accuracy_score(y_test, y_pred_gini)
print("Accuracy using Gini-index impurity measure with PCA:", accuracy_gini)
```

```

ROC Curve

X_train_raw shape: (70000, 8)
y_train shape: (70000,)
X_test_raw shape: (30000, 8)
y_test shape: (30000,)

11   Inference

1.Accuracy using Entropy impurity measure without PCA: 0.9542666666666667 Accuracy using Gini-index impurity measure without PCA: 0.9530333333333333

2.Accuracy using Entropy impurity measure with PCA: 0.9377857142857143

Accuracy using Gini-index impurity measure with PCA:
0.9399285714285714

As we can clearly see that the accuracy of the decision tree classifier using Gini-index and Entropyusing PCA gives less accuracy than without using PCA.

12   Learning Outcomes

1. Applying standardization and other pre-processing techniques.
2. Splitting the data according to PCA.
3. Understanding Decision Tree classifier Algorithm.
4. Implementing decision tree classifier model.
5. Implementing the decision tree model with using PCA and

without using PCA.GITHUB LINK:
